# ~~Vinylchlorocyclotriphosphazenes~~

Kolikkara Ramachandran and Christopher W. Allen\*, Department of Chemistry,  
University of Vermont, Burlington, Vermont 05405.

~~Abstract:~~ The reactions of the lithium enolate of acetaldehyde,  $\text{LiOCHCH}_2^n$ , with hexachlorocyclotriphosphazene,  $\text{N}_3\text{P}_3\text{Cl}_6$ , lead to the series of vinylchlorocyclotriphosphazenes,  $\text{N}_3\text{P}_3\text{Cl}_{6-n}(\text{OCH=CH}_2)_n$  ( $n = 1-6$ ). Evidence for the occurrence of all possible geometrical and positional isomers in the series has been obtained from the  $^{31}\text{P}$  nmr spectra. The principal products are the non-geminal species with comparable amounts of cis and trans isomers being formed. Small amounts of the geminal isomers are also observed. The mono- and pentakis substituted derivatives have been converted to their dimethylamino derivatives,  $\text{N}_3\text{P}_3(\text{OCH=CH}_2)_{6-n}[\text{N}(\text{CH}_3)_2]_n$  ( $n = 1,5$ ).

## Introduction

Although there have been extensive investigations into the reactions of amines<sup>1-3</sup> and more recently of organometallic reagents<sup>4</sup> with cyclophosphazenes, the corresponding reactions with alcohols have received considerably less attention. Detailed studies of the substitution pattern followed in the reactions of phenoxide<sup>5</sup> and the trifluoroethoxide<sup>6</sup> ions with hexachlorocyclotriphosphazene,  $N_3P_3Cl_6$ , have appeared. Less detailed studies of the reactions of other selected alkoxides with  $N_3P_3Cl_6$  have also been carried out.<sup>7</sup> In all cases a non-geminal pathway is preferred. Recently, we have shown that the ambident enolate anions undergo reactions with the hexahalocyclotriphosphazenes,  $N_3P_3X_6$  ( $X = F, Cl$ ), to yield the vinyloxypentahalocyclotriphosphenes,  $N_3P_3X_5OCR=CH_2$ .<sup>8</sup> The favorable combination of the hard acid (phosphorus (V)) with the hard base (oxygen) leads to exclusive attack at the oxygen end of the enolate anion and thus provides a route to previously inaccessible vinyl alcohol derivatives. In this paper, we present the synthesis and characterization of the series of vinyloxychlorocyclotriphosphazenes,  $N_3P_3Cl_{6-n}(OCH=CH_2)_n$  ( $n = 1-6$ ). This study is of interest in terms of exploring the substitution pathway of oxygen based nucleophiles with cyclophosphazenes. These materials are also new organofunctional phosphazenes which can serve as precursors to new monomeric and polymeric phosphazene derivatives.<sup>9</sup>

# Experimental:

Hexachlorocyclotriphosphazene,  $N_3P_3Cl_6$ , (Ethyl Corp.), was recrystallized from petroleum ether to a constant m.p.  $113^\circ C$ . n-Butyl lithium (1.6 M solution in hexane) was obtained from Aldrich. Tetrahydrofuran (THF) (Aldrich) was distilled from sodium-benzophenone ketyl. Petroleum ether (b.p.  $35-55^\circ C$ ), benzene<sup>10</sup> and ethyl acetate (Fisher) were distilled by standard procedures. NMR spectra (in  $CDCl_3$ ) were recorded on a Brücker WM 250 spectrometer operating at 250.1 MHz ( $^1H$ ), 62.9 MHz ( $^{13}C$ ) and 101.2 MHz ( $^{31}P$ ). Tetramethylsilane (TMS) was used as internal reference for  $^1H$  and  $^{13}C$  NMR measurements. For  $^{31}P$  NMR, 85%  $H_3PO_4$  was used as an external standard. Chemical shifts upfield to the reference are assigned a negative sign.  $^{13}C$  and  $^{31}P$  NMR spectra were recorded under conditions of broad band decoupling. Infrared (IR) spectra were obtained as their thin films (NaCl disks) on a Beckman IR 20A spectrometer. Mass spectra were recorded on a Perkin Elmer RMU - 6D spectrometer operating at 80eV. Elemental analyses were performed by Integral Microanalytical Laboratories. The NMR spectra of mixtures were simulated using a locally modified version of the computer program DNMR3.<sup>11</sup> The "spectral vector output" (i.e. an intensity parameter) of DNMR3 was modified to accommodate the calculation of spectra composed on several overlapping subspectra.

## Preparation of $N_3P_3Cl_5OCH=CH_2$ (1) and $N_3P_3Cl_4(OCH=CH)_2$ (2).

A solution of 10.5g (30.2 mmol) of  $N_3P_3Cl_6$  was treated with 70.0 mmol of  $LiOCH=CH_2$ .<sup>12</sup> A 2 gm sample of the product was separated by flash chromatography<sup>13</sup> to yield 0.92 gm (44.3% of theory) of  $N_3P_3Cl_5OCH=CH_2$  (1) as previously described.<sup>8</sup> Continued elution from the column yielded 0.70g (32.80% theory) of a colorless liquid, b.p.  $55-57^\circ C$  at 0.02 mm Hg. Anal. Calcd. for  $C_4H_6Cl_4N_3O_2P_3$  (2):

C, 13.22; H, 1.58; mol. wt. 361. Found: C, 13.15; H, 1.72; mol wt. 361 (mass spectrum).

$^1\text{H}$  NMR:<sup>14</sup>  $\delta_{\equiv\text{P}-\text{O}-\text{CH}=\text{CH}_2}$  = 6.6 - 6.4 (complex multiplet);  $\delta_{\equiv\text{P}-\text{O}-\text{CH}=\text{CH}_2}$  (trans) = 5.2 - 5.0 (complex multiplet);  $\delta_{\equiv\text{P}-\text{O}-\text{CH}=\text{CH}_2}$  (cis) = 4.9 - 4.8 (complex multiplet).

$^{31}\text{P}$  NMR: For nongeminal isomers:  $\delta_{\equiv\text{PCl}_2}$  = 24.8,  $\delta_{\equiv\text{PCl}(\text{OCH}=\text{CH}_2)}$  = 15.8,  $^2\text{J}_{\text{P-P}}$  = 67.3;  $\delta_{\equiv\text{PCl}(\text{OCH}=\text{CH}_2)}$  = 15.6,  $^2\text{J}_{\text{P-P}}$  = 67.5 for geminal isomer:  $\delta_{\equiv\text{PCl}_2}$  = 24.5 (d, 2P),  $^2\text{J}_{\text{P-P}}$  = 68.4,  $\delta_{\equiv\text{P}(\text{OCH}=\text{CH}_2)_2}$  = -0.6 (t, 1P),  $^2\text{J}_{\text{P-P}}$  = 69.0.

Preparation of  $\text{N}_3\text{P}_3\text{Cl}_3(\text{OCH}=\text{CH}_2)_3$  (3) and  $\text{N}_3\text{P}_3\text{Cl}_2(\text{OCH}=\text{CH}_2)_4$  (4).  
 ~~~~~

The lithium enolate prepared from  $n\text{-C}_4\text{H}_9\text{Li}$  (45 ml, 72 mmol) and THF (80 ml) was added to a solution of  $\text{N}_3\text{P}_3\text{Cl}_6$  (7.5g, 21.7 mmol) in THF (70 ml) at room temperature. The reaction mixture was stirred for five days and worked up as before to give 7.0g of a pale yellow liquid. A 2.0 g sample of this liquid was purified using flash chromatography. The following compounds were obtained in succession:  $\text{N}_3\text{P}_3\text{Cl}_5\text{OCH}=\text{CH}_2$  (1), 0.15g (6.71% of theory);  $\text{N}_3\text{P}_3\text{Cl}_4(\text{OCH}=\text{CH}_2)_2$  (2), 0.35g (15.34% of theory). The third compound eluted was distilled under reduced pressure to yield 0.40g (17.18% of theory) of a colorless liquid b.p. 90° C at 0.05 mm Hg. Anal. Calcd. for  $\text{C}_6\text{H}_9\text{Cl}_3\text{N}_3\text{O}_3\text{P}_3$  (3): C, 19.43; H, 2.43; mol. wt. 369. Found: C, 19.12; H, 2.41; mol. wt. 369 (mass spectrum).

$^1\text{H}$  NMR:<sup>14</sup>  $\delta_{\equiv\text{P}-\text{O}-\text{CH}=\text{CH}_2}$  = 6.6-6.4 (complex multiplet);  $\delta_{\equiv\text{P}-\text{O}-\text{CH}=\text{CH}_2}$  (trans) = 5.1-5.0 (complex multiplet);  $\delta_{\equiv\text{P}-\text{O}-\text{CH}=\text{CH}_2}$  (cis) = 4.8-4.6 (complex multiplet).  $^{31}\text{P}$  NMR:<sup>16</sup>  $\delta_{\equiv\text{PCl}_2}$  = 27.3,  $\delta_{\equiv\text{PCl}(\text{OCH}=\text{CH}_2)}$  = 18.0,  $\delta_{\equiv\text{P}(\text{OCH}=\text{CH}_2)_2}$  = 3.0. IR:<sup>15</sup> 1640(s, C=C str.), 1230 (s, PN str.), 1120 (s, PO str.), 1025 (2), 930 (m, PCl), 900 (m, PCl), 790(m, PCl).

The fourth compound obtained was distilled under reduced pressure to give 0.52g (21.88% of theory) of a viscous liquid, b.p. 96°C at 0.05 mm Hg. Anal. Calcd. for  $C_8H_{12}Cl_2N_3O_4P_3$  (4): C, 25.40; H, 3.17, mol. wt. 377. Found: C, 24.53; H, 2.90; mol. wt. 377 (mass spectrum).

$^1H$  NMR:  $^{14}$   $\delta$ -O-CH=CH<sub>2</sub> = 6.6-6.4 (complex multiplet);  $\delta$ -O-CH=CH<sub>2</sub> (trans) = 5.1-4.9 (complex multiplet);  $\delta$ -O-CH=CH<sub>2</sub> (cis): 4.8-4.7 (complex multiplet).  $^{31}P$  NMR: for geminal isomer:  $\delta$ ≡PCl<sub>2</sub> = 28.9;  $\delta$ ≡P(OCH=CH<sub>2</sub>)<sub>2</sub> = 5.7,  $^2J_{P-P}$  = 75.7. For non-geminal isomers:  $\delta$ ≡PCl(OCH=CH<sub>2</sub>) = 21.6;  $\delta$ ≡P(OCH=CH<sub>2</sub>)<sub>2</sub> = 6.1,  $^2J_{P-P}$  = 83.4;  $\delta$ ≡PCl(OCH=CH<sub>2</sub>) = 21.4,  $\delta$ ≡P(OCH=CH<sub>2</sub>)<sub>2</sub> = 6.1,  $^2J_{P-P}$  = 80.6 IR:  $^{15}$  1645(s, C=C str.), 1230 (s, PN str.), 1115 (s, PO str.), 1025 (s), 930 (m, PCl), 905 (m, PCl), 785 (m, PCl).

Preparation of  $N_3P_3Cl(OCH=CH_2)_5$  (5) and  $N_3P_3(OCH=CH_2)_6$  (6)

The reaction of the lithium enolate prepared from n-C<sub>4</sub>H<sub>9</sub>Li (85 ml, 136 mmol) and THF (160 ml) with N<sub>3</sub>P<sub>3</sub>Cl<sub>6</sub> (6.0g, 17.2 mmol) in THF (100 ml) was carried out as described above to yield 5.6g of a pale yellow liquid. A 1.0g sample of this liquid was purified using flash chromatography with petroleum ether - ethyl acetate (97/3) as the eluant. The first product obtained was a viscous liquid which was distilled under reduced pressure to give 0.36g (30.78% of theory) of a colorless liquid, b.p. 105°C at 0.05 mm Hg. Anal. Calcd. for C<sub>10</sub>H<sub>15</sub>ClN<sub>3</sub>O<sub>5</sub>P<sub>3</sub> (5): C, 31.13; H, 3.89; mol. wt., 385. Found: C, 30.39, H, 3.70; mol. wt. 385 (mass spectrum).

$^1H$  NMR:  $^{14}$   $\delta$ -O-CH=CH<sub>2</sub> = 6.7-6.4 (complex multiplet);  $\delta$ -O-CH=CH<sub>2</sub> (trans): 5.1-5.0 (complex multiplet);  $\delta$ -O-CH=CH<sub>2</sub> (cis) = 4.9-4.6 (complex multiplet).  $^{31}P$  NMR:  $\delta$ ≡PCl(OCH=CH<sub>2</sub>) = 23.9,  $\delta$ ≡P(OCH=CH<sub>2</sub>)<sub>2</sub> = 8.7,  $^2J_{P-P}$  = 85.0.  $^{13}C$  NMR: ≡PCl(OCH=CH<sub>2</sub>) group:  $\delta$ C<sub>α</sub> = 141.0 (d),  $^3J_{PC}$  = 8.5; C<sub>β</sub> = 102.7 (d),  $^3J_{PC}$  = 12.2, ≡P(OCH=CH<sub>2</sub>)<sub>2</sub> group:  $\delta$ C<sub>α</sub> = 141. (s),  $\delta$ C<sub>β</sub> = 101.8 (m),  $^2J_{PC}$  = 12.2. IR:  $^{15}$  1645 (s, C=C str.), 1240 (s, PN str.), 1110 (s, PO str.), 1025 (s), 920 (m, PCl), 860 (m, PCl), 770 (m, PCl).

The next product was distilled under reduced pressure to yield 0.30g (25.15% of theory) of a viscous liquid, b.p. 110°C at 0.05mm Hg. Anal. Calcd. for  $C_{12}H_{18}N_3O_6P_3$  (6): C, 36.64; H, 4.58; mol. wt. 393. Found: C, 35.88; H, 4.01, mol. wt. 393 (mass spectrum).

$^1H$  NMR:  $^{14}\delta_{-O-\underline{CH}=\underline{CH}_2} = 6.5$  (center of a complex multiplet),  $\delta_{-O-\underline{CH}=\underline{CH}_2}$  (trans) = 4.9 (center of a complex multiplet),  $\delta_{-O-\underline{CH}=\underline{CH}_2}$  (cis) = 4.5 (center of a complex multiplet),  $^{13}C$  NMR:  $\delta_{C_\alpha} = 141.6$  (d),  $J_{PC_\alpha} = 2.4$ ,  $\delta_{C_\beta} = 101.3$  (m):  $^{31}P$  NMR:  $\delta_{\equiv P(OCH=\underline{CH}_2)_2} = 11.3$  (s). IR:  $^{15}$  1645 (s, C=C str.), 1245 (s, PN str.), 1130 (s, PO str.), 1010 (s), 865(m), 810(m), 760(m), 690(m).

#### Preparation of $N_3P_3(OCH=\underline{CH}_2)(NMe_2)_5$ (7)

The reaction of  $N_3P_3Cl_5OCH=\underline{CH}_2$  (1), (2.5g, 7.1 mmol) with an excess of anhydrous dimethylamine (10.5g, 233.3 mmol) in chloroform (100 ml) at 0°C was allowed to proceed for 24hr. After removal of the solvent, the oily residue was extracted with petroleum ether (250 ml). The amine hydrochloride and petroleum ether were removed and the remaining liquid was distilled to yield 2.0g (71.8% of theory) of a colorless liquid, b.p. 90°C at 0.05 mm Hg. Anal. Calcd. for  $C_{12}H_{33}N_8OP_3$  C, 36.18, H, 8.29; mol. wt. 398. Found: C, 37.67; H, 8.12; mol. wt. 398 (mass spectrum).

IR:<sup>15</sup> 2880 (s, CH str.), 1640 (s, C=C str.), 1460 (s,  $\delta_{as}$  CH<sub>3</sub>), 1275 (s, PN str.), 1190 (s), 1120 (s, PO str.), 1060 (m), 880 (m, PN), 750 (m), 670 (m).

#### Preparation of N<sub>3</sub>P<sub>3</sub>(OCH=CH<sub>2</sub>)<sub>5</sub>NMe<sub>2</sub> (8)

Anhydrous dimethylamine (10.0g, 222 mmol) was added to a solution of N<sub>3</sub>P<sub>3</sub>Cl(OCH=CH<sub>2</sub>)<sub>5</sub> (5) (0.5g, 1.4 mmol) in toluene (50 ml) at 0°C and the reaction was allowed to proceed as above. The resultant liquid was distilled under reduced pressure to give 0.45g (87.8% of theory) of a colorless liquid b.p. 105°C at 0.05mm Hg. Anal. Calcd. for C<sub>12</sub>H<sub>21</sub>N<sub>4</sub>O<sub>5</sub>P<sub>3</sub> : C, 36.92; H, 5.38; mol. wt. 350. Found: C, 36.37; H, 5.18; mol. wt. 350 (mass spectrum).

<sup>1</sup>H NMR:<sup>14</sup>  $\delta$ -O-CH=CH<sub>2</sub> = 6.5 (center of a complex multiplet),  $\delta$ -O-CH=CH<sub>2</sub> (trans): 4.9 (center of a complex multiplet);  $\delta$ -O-CH=CH<sub>2</sub> (cis): 4.6 (center of a complex multiplet),  $\delta$ -NMe<sub>2</sub> = 2.7 (d), <sup>3</sup>J<sub>P-H</sub> = 12.2. <sup>13</sup>C NMR:  $\equiv$ P(OCH=CH<sub>2</sub>)(NMe<sub>2</sub>) group:  $\delta$ C<sub>α</sub>: 99.6 (d), J<sub>PC</sub> = 11.0;  $\delta$ C<sub>β</sub>: 142.3, J<sub>PC</sub> = 7.32;  $\delta$ -N(Me<sub>2</sub>) = 36.3 (d); <sup>3</sup>J<sub>P-C</sub> = 3.7;  $\equiv$ P(OCH=CH<sub>2</sub>)<sub>2</sub> group:  $\delta$ C<sub>α</sub> = 141.8 (s),  $\delta$ C<sub>β</sub> = 100.4 (m). <sup>31</sup>P NMR:  $\delta$  $\equiv$ P(OCH=CH<sub>2</sub>)(NMe<sub>2</sub>) = 22.2,  $\delta$  $\equiv$ P(OCH=CH<sub>2</sub>)<sub>2</sub> = 11.7, <sup>2</sup>J<sub>PP</sub> = 74.6.

IR:<sup>15</sup> 2920 (m, CH str.), 1645 (s, C=C str.), 1240 (s, PN str.), 1125 (s, PO str.), 1010(s), 920 (m, PN), 870 (m, PN), 810 (m), 770 (m), 695 (m).

#### Results and Discussion

There are two possible routes of reaction for an ambident enolate anion leading to derivativization of either the oxygen end or the carbon end of the nucleophile.<sup>17</sup> We have previously shown that the phosphazene is attacked by the oxygen end of the enolate anion in the formation of the monosubstituted derivatives.<sup>8</sup> The <sup>1</sup>H and <sup>13</sup>C nmr spectra of all the new compounds reported in this investigation closely resemble those of the monosubstituted derivative. In particular, the proton spectra resemble

vinylacetate with additional phosphorus coupling and there are no alkyl or carbonyl carbon atoms observed in the  $^{13}\text{C}$  nmr spectra.<sup>18</sup> The nmr spectra of authentic phosphazenes with  $\beta$ -carbonyl functions (the hypothetical product resulting from the attack on the carbon end of the enolate) have recently been reported and differ significantly from the products of the enolate anion reactions.<sup>19</sup> Consequently, we may conclude that the reaction generally leads to the vinyloxy derivatives as shown below. These materials are stable to air and atmospheric moisture.

The monosubstituted derivative,  $\mathbf{1}$ , has an  $\text{AB}_2$   $^{31}\text{P}$  nmr spectrum appropriate to the proposed structure. Further characterizational details were previously reported.<sup>8</sup> The chlorine atoms in  $\mathbf{1}$  were removed by the reaction of  $\mathbf{1}$  with dimethylamine to give  $\text{N}_3\text{P}_3[\text{N}(\text{CH}_3)_2]_5\text{OCH}=\text{CH}_2$ . The  $^1\text{H}$  and  $^{31}\text{P}$  nmr spectra of this derivative are consistent with the formulation given above. The fact that  $\mathbf{1}$  can be derivatized leaving the vinyl group intact demonstrates that one can potentially prepare a series of organofunctional phosphazene monomers of the type  $\text{N}_3\text{P}_3\text{X}_5\text{OCH}=\text{CH}_2$  starting with  $\mathbf{1}$ .

A mixture of bis isomers,  $\mathbf{2}$ , which resisted further chromatographic separation, was isolated. The absence of mono or trisubstituted species was confirmed by mass spectrometry. The  $^{31}\text{P}$  nmr spectrum of  $\mathbf{2}$  (Figure 1) clearly shows the existence of all three positional and geometric isomers of the composition  $\text{N}_3\text{P}_3\text{Cl}_4(\text{OCH}=\text{CH}_2)_2$ . The nmr parameters for each isomer were estimated from the mixture spectrum and used to simulate the individual spectra. The mixture spectrum was matched to the composite of the individual spectra (Figure 1) by varying the contributions of each of the components thus allowing for calculation of the relative concentration of each species.<sup>20</sup> There is a low intensity  $\text{A}_2\text{X}$  spectrum (Figure 1a) in which the A part is in the  $\equiv\text{PCl}_2$  chemical shift range while the X part is in the general range found in  $\text{N}_3\text{P}_3(\text{OCH}=\text{CH}_2)_6$ .

The  $A_2X$  spectrum, with A being  $\equiv PCl_2$ , is consistent only with the geminal isomer. Excluding spirocyclic species, this is the first example of a geminal  $N_3P_3Cl_4(OR)_2$  species formed in the reactions of nucleophiles derived from alcohols with  $N_3P_3Cl_6$ . The non-geminal isomers both exhibit  $AB_2$  spectra (Figure 1 b,c) with identical A regions. In the  $B(\equiv PCl(OCH=CH_2))$  region the chemical shifts are slightly different. The relative abundances of each isomer as obtained from the simulation study are 4% geminal and 43 and 53% respectively for the two non-geminal isomers. This characterization of the mixture of bis isomers by high field  $^{31}P$  nmr and simulation studies demonstrates the value of this approach in both qualitative and quantitative studies of phosphazene substitution reactions. The proton nmr spectrum of the mixture, is as expected, complex. In the region associated with  $H_a$  ( $-OCH_a=CH_2$ ) there is a triplet<sup>21</sup> in low abundance which is slightly upfield from the  $H_a$  resonances for  $\equiv PCl(OCH=CH_2)$  environment. The intensity of the triplet increases as one goes through the  $N_3P_3Cl_{6-n}(OCH=CH_2)_n$  series and so it may be taken as an indicator of the amount of species containing the  $\equiv P(OCH=CH_2)_2$  center in a mixture.

Given the propensity for trans isomer formation observed in the reactions of cyclotriphosphazenes with alkyl and dialkylamines,<sup>2,22</sup> tert-butyl lithium<sup>23</sup> and the trifluoroethoxide ion<sup>6</sup>, it is tempting to suggest that the isomer in greatest abundance is trans -2,4- $N_3P_3Cl_4(OCH=CH_2)_2$ . Any assignment of this type must be considered as tenuous since there is very little knowledge of isomer ratios in the reactions of  $N_3P_3Cl_6$  with oxygen bases and the fact that a few reactions of cyclotriphosphazenes with nucleophiles such as phenyl lithium<sup>24</sup> and the phenoxide ion<sup>25</sup> appear to give the cis isomer predominantly. In the case of the bis dimethylaminochlorocyclotriphosphazenes, the  $^{31}P$  nmr chemical shift for the  $\equiv PClN(CH_3)_2$  center is more positive for the trans (compared to the cis) isomer.<sup>26</sup> In  $N_3P_3Cl_4(OCH=CH_2)_2$ , the less abundant non-geminal isomer has the more positive

chemical shift for the  $\equiv\text{PCl}(\text{OCH}=\text{CH}_2)$  center. These observations also cast doubt on the suitability of assigning the trans configuration to the more abundant isomer in **2**.

The results presented above indicate interesting differences in the reaction pattern in the reactions of  $\text{N}_3\text{P}_3\text{Cl}_6$  with  $\text{LiOCH}=\text{CH}_2$  and  $\text{NaOCH}_2\text{CF}_3$ . In the latter system, the geminal isomer was not observed and the trans isomer was in significantly greater abundance (trans: cis > 5:1).<sup>6</sup> There is not sufficient data to speculate on the reasons for these differences. In particular the roles of the counter ion and the solvent bear further investigation.

The sample, **3**, with the stoichiometry  $\text{N}_3\text{P}_3\text{Cl}_3(\text{OCH}=\text{CH}_2)_3$  has a complex  $^1\text{H}$  nmr spectrum with evidence for the  $\equiv\text{P}(\text{OCH}=\text{CH}_2)_2$  center in small amounts. The  $^{31}\text{P}$  nmr spectrum of **3** shows evidence for all three isomers (geminal, cis -2,4,6, trans -2,4,6). A doublet of doublets in the  $\equiv\text{P}(\text{OCH}=\text{CH}_2)_2$  region along with a triplet (center lines of doublet of doublets merged) in the  $\equiv\text{PCl}_2$  region confirm the presence of the geminal (2,2,4) isomer. The  $\equiv\text{PCl}(\text{OCH}=\text{CH}_2)$  region contains peaks from the geminal isomer, a large singlet corresponding to the cis isomer and an  $\text{AB}_2$  pattern assignable to the trans isomer. The overlap of all of these resonances precludes the obtaining of quantitative information concerning isomer ratios. The pattern established at the level of bis substitution is qualitatively maintained i.e. predominantly non-geminal with traces of the geminal product being observed.

The  $^{31}\text{P}$  nmr sample of **4**, the tetrakis sample, again indicates the existence of all three isomers. The geminal isomer is in very low abundance and is characterized by an  $\text{AX}_2$  spectrum with A in the  $\equiv\text{PCl}_2$  and X in the  $\equiv\text{P}(\text{OCH}=\text{CH}_2)$  region. There are two sets of closely spaced  $\text{A}_2\text{X}$  spectra covering the  $\equiv\text{PCl}(\text{OCH}=\text{CH}_2)_2$  and  $\equiv\text{P}(\text{OCH}=\text{CH}_2)_2$  regions which correspond to the non-geminal cis and trans isomers in nearly equal amounts.

The pentakis derivative,  $\zeta$ , exhibits an  $AB_2$   $^{31}\text{P}$  nmr spectrum which is approaching  $AX_2$ . In aminophosphazene derivatives, materials which appear to be  $\text{N}_3\text{P}_3\text{Cl}(\text{NR}_2)_5$  are often hydrochlorides of  $\text{N}_3\text{P}_3(\text{NR}_2)_6$ <sup>2</sup> so we carried out the reaction of  $\zeta$  with dimethylamine to yield  $\text{N}_3\text{P}_3\text{N}(\text{CH}_3)_2(\text{OCH}=\text{CH}_2)_5$  thus providing chemical structure proof of the proposed formulation of  $\zeta$ .

The  $^{31}\text{P}$  nmr spectrum of the hexa substituted material,  $\delta$ , has the expected singlet in the  $\equiv\text{P}(\text{OCH}=\text{CH}_2)_2$  region. The  $^1\text{H}$  nmr spectrum shows a curious anomaly in that there is an increase in the number of lines in the  $\text{H}_a$  region over what is observed in  $\lambda$ . The origins of this complication are unclear but it does suggest different environments for the exocyclic substituents.

In summary, it has been shown that the reaction of the lithium enolate of acetaldehyde with  $\text{N}_3\text{P}_3\text{Cl}_6$  leads to the complete series of compounds of the type  $\text{N}_3\text{P}_3\text{Cl}_{6-n}(\text{OCH}=\text{CH}_2)_n$ . The non-geminal pathway is favored. This new, and to date most complete, series of organofunctional phosphazenes can be expected to form the basis of extensive new incorporation of cyclophosphazenes into polymeric systems.<sup>9</sup> Of particular interest is the possibility that the non-geminal species will be reagents for novel cross-linking and related reactions. Work along these lines is currently in progress in our laboratory.

~~Acknowledgements.~~ This work was supported in part by the Office of Naval Research. We also wish to thank Professor C. H. Bushweller for providing the modified DNMR3 program and Mr. R. Bright and Mr. Christopher Rithner for carrying out the simulation studies.
